Waste Water Treatment and Separation Technology

Separator with automatic cleaning device. Available in two different sizes, also without cleaning device.

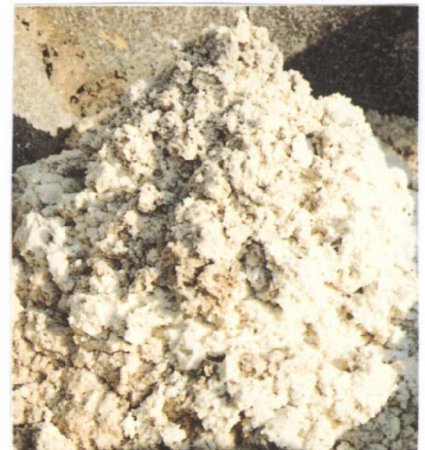

This cleaning basin - available in all sizes - has plastic chains and pushers to remove submerged particles as well as particles floating on the surface. The two types of particles are removed on opposite sides.

The cleaning device of our separator has its own air supply.

Separator with inlet at the top. The filtered water is discharged at the bottom.

Potato peel waste from the separator. Peeling was done by carborundum machines. The waste is "dry" and just capable of being pumped.

Separators are used to separate liquids from solids. Even smaller particles can be separated. The separated waste can be used as animal feed and in many plants the filtered water can be reused in order to cut water consumption and sewage costs.
